Blog Tracker Application

1 . Create admininfo.cs, Empinfo.cs and Bloginfo.cs in Blog lib.

2 . Create Asp.net core Web API in VS 2022 and Download required Dependencies.

3 . Use Scaffold-DbContext to connect your DB to our project, it will automatically

create models and its DbContext file .

4 . Run and Check if all the CRUD operations are operational in the swagger

5 . Now Create a New Asp.Net Mvc project in the same solution explorer.

6 . Create the controllers for admin, emp, blog and login in mvc.

7 . Enable both projects to run at the same time when the build is entered.

8 . Create the models same as models in the Web Api

9 . In controllers, using HTTP Client request connect the Web Api data to our MVC

Project for CRUD operations

10 . Create Views for the respective fields

11 . In Shared layout, change the layout for our requirements

12 . Assign login and logout in the _layout view

13 . And add nunit testing and add lib reference to test and perform nunit operations.

14 . Build and Run the program

15 . Check if all the functions works perfectly.

16 . If all runs perfectly, then close the program.
